## ABSTRACT

This KIDS COUNT report examines statewide trends in the well-being of Rhode Island's children. Five chapters address the areas of family and community, economic well-being, child health, safety, and education. The statistical portrait is based on 23 indicators of well-being: (1) children in single parent families; (2) median household income; (3) children in poverty; (4) children receiving public assistance; (5) rent burden; (6) women with delayed prenatal care; (7) low birthweight infants; (8) infant mortality; (9) births to teens; (10) women and children receiving WIC; (11) children receiving school breakfast; (12) children with lead poisoning; (13) children without health insurance; (14) additional children's health issues; (15) child deaths; (16) teen deaths; (17) juveniles referred to family court; (18) child abuse and neglect; (19) child care; (20) children enrolled in Head Start; (21) fourth-grade reading skills; (22) high school graduation rate; and (23) teens not in school and not working. The information on each indicator is organized as follows: definitions, significance, sidebars, city/town tables, core cities data, comparison data, and most recent available data. Findings show two-thirds of poor children are white, yet non-white children are more than three times as likely to be living in poverty. (SD)

# The Poet Speaks

I know there seems to be  
Little reason or rhyme  
For poets who write of beauty  
In such conflicting times...  
But I am one of those  
Who strives to yield,  
Golden fruits, from stone fields.

- John Henrik Clarke

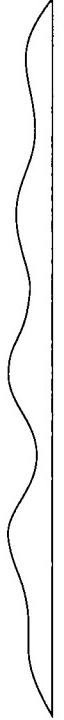

**Rhode Island KIDS COUNT** is a children's policy and information project sponsored by the Annie E. Casey Foundation and The Rhode Island Foundation, in partnership with Brown University's A. Alfred Taubman Center and the Rhode Island College School of Social Work. KIDS COUNT is a national and state-by-state effort to track the status of children in the United States. By providing policymakers and citizens with benchmarks of child well-being, Rhode Island KIDS COUNT seeks to enrich local, state, and national efforts to secure a better future for all children.

The *1996 Rhode Island KIDS COUNT Factbook* is the second annual profile of the well-being of children in Rhode Island. The *1996 Factbook* provides a statistical portrait of the status of Rhode Island's children. By examining the best available data statewide and in Rhode Island's 39 cities and towns, Rhode Island KIDS COUNT provides an information base that can result in more effective policy and community action on behalf of children.

The *1996 Rhode Island KIDS COUNT Factbook* examines twenty-three indicators in five areas that affect the lives of children: Family and Community, Economic Well-Being, Health, Safety, and Education. The information on each indicator is organized as follows:

- ◊ **Definition:** A description of the indicator and what it measures.
- ◊ **Significance:** The relationship of the indicator to child and family well-being.
- ◊ **Sidebars:** Current state and national data and information related to the indicator.
- ◊ **City/Town Tables:** Data for each indicator presented for each of Rhode Island's cities and towns, the state as a whole, and the core cities.
- ◊ **Core Cities Data:** The core cities are the five communities in which more than 15% of the children live below the poverty level: Providence, Pawtucket, Woonsocket, Newport, and Central Falls.

- ◊ **Comparison Data:** City/town tables show current data compared to earlier data from the 1995 Factbook, whenever possible.
- ◊ **Most Recent Available Data:** The 1996 Factbook uses the most current, reliable data available for each indicator.
- ◊ **New Indicators:** Three new indicators have been added to the twenty indicators included in the first Rhode Island KIDS COUNT Factbook. The new indicators are "Children without Health Insurance", "Child Care", and "Fourth-Grade Reading Skills".

**Focus on the Whole Child**

- ◊ All areas of child well-being are interrelated and critical throughout a child's development. A child's safety in his family and community affects his school performance; a child's economic security affects her health and education. Changes in child well-being in any area — Family and Community, Economic Well-Being, Health, Safety, Education — will affect other areas.
- ◊ The *1996 Rhode Island KIDS COUNT Factbook* begins to establish benchmarks of child well-being that can guide children's policy, programs for children and families, and community service on behalf of children. The indicators can be used as a tool to set priorities that improve outcomes for children.
- ◊ It is the hope of Rhode Island KIDS COUNT that the Factbook will empower community leaders, policymakers, advocates and individuals to work toward changes that will improve the quality of life for all of Rhode Island's children.

# Celebration

I shall dance tonight.  
When the dusk comes crawling,  
There will be dancing  
and feasting.  
I shall dance with the others  
in circles,  
in leaps,  
in stomps.  
Laughter and talk  
will weave into the night,  
Among the fires of my people.  
Games will be played  
And I shall be  
a part of it.

- Alonzo Lopez

# Family and Community

# Child Population

**DEFINITION**  
*Child population* is the percentage of the total population that is under the age of 18.

## SIGNIFICANCE

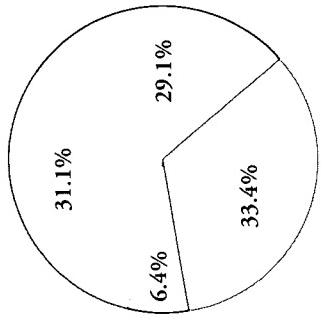

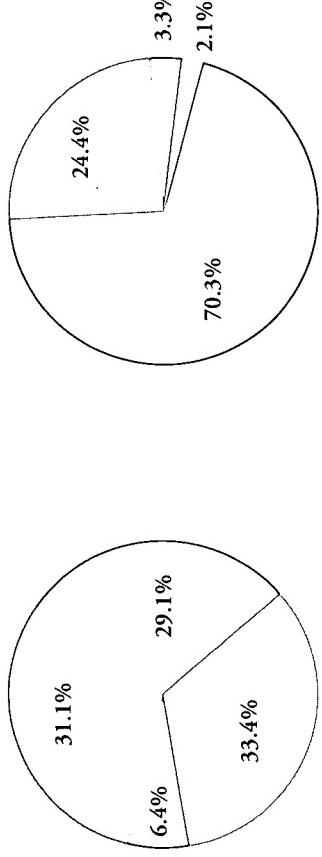

Rhode Island's children are diverse in race, ethnic background, language and country of origin. While the total population of children decreased from 1980 to 1990, the number of children under age 5 increased 20%. Children under age 18 are significantly more diverse in racial and ethnic backgrounds than the

adult population. Compared to non-Hispanic whites, minority children in Rhode Island are three times more likely to live in poverty. Many face language barriers. In 1990, more than 25,000 Rhode

Island children ages 5 to 17 spoke a language other than English at home. For some, immigration brings the added challenges of adjustment and assimilation. In 1990, 13,500 of Rhode Island's children were born outside the U.S., including 5,400 Hispanic children and 3,300 Asian children.

# Children in Single Parent Families

## DEFINITION

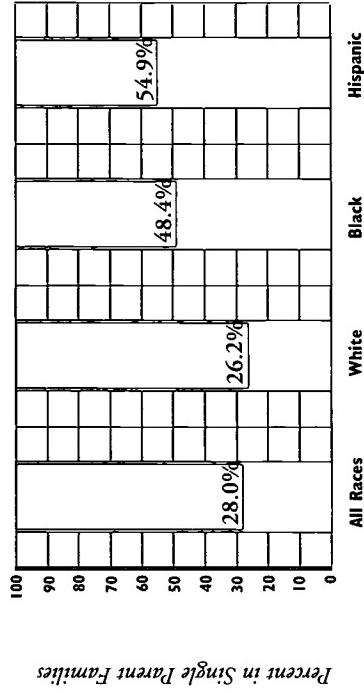

*Children in single parent families* is the percentage of children under age 18 who live in families headed by a person – male or female – without a spouse present in the home. These numbers include “own children” defined as never-married children under 18 who are related to the family head by birth, marriage, or adoption.

than one in four lived in a single parent family in 1993. In 1994, thirty-four percent of all births in Rhode Island were to unmarried women. With the increasing number of non-marital births and a continuing high divorce rate, the proportion of children living with one parent has almost doubled since 1970. The increase in single parent families over the past three decades has occurred across all races and income levels.

## SIGNIFICANCE

Children in single parent families are at increased risk of living in poverty when compared to children in two-parent families. When the single parent is a woman, the risk of falling into poverty is greater, due partly to the wage gap between men and women, and inadequate child support. According to the Center for Demographic Policy in Washington D.C., sixty percent of all children in the United States will spend some time in a single parent family before reaching age 18. Although most Rhode Island children live with two parents,<sup>more</sup> 20

**Children in Single Parent Families, by Race, Rhode Island, 1993**

*Note: Percentages are calculated within each race or ethnic group*

- ◊ Nearly 75% of American children growing up in single parent families experience poverty for some period in their first ten years — compared to 20% of children in two-parent families.
- ◊ In 1993, the average household income in Rhode Island for two-parent families with children was \$48,716 compared to \$18,431 for single parent families headed by a woman.
- ◊ In Rhode Island in 1993, six out of ten female-headed families with children were living below the poverty line.
- ◊ Most poverty, including that of female-headed households, occurs because of factors related to wages and the availability of jobs, education and training for productive participation in the labor force.

Sources: D.T. Ellwood, *Poor Support: Poverty in the American Family* (1988); U.S. Bureau of the Census, Current Population Survey, 1991 to 1995 average.

# 26 Economic Well-being

# Median Household Income

## DEFINITION

*Median household income* is the median annual income for Rhode Island households. The median income is the dollar amount which divides the income distribution into two equal groups – half with income above the median and half with income below the median.

## SIGNIFICANCE

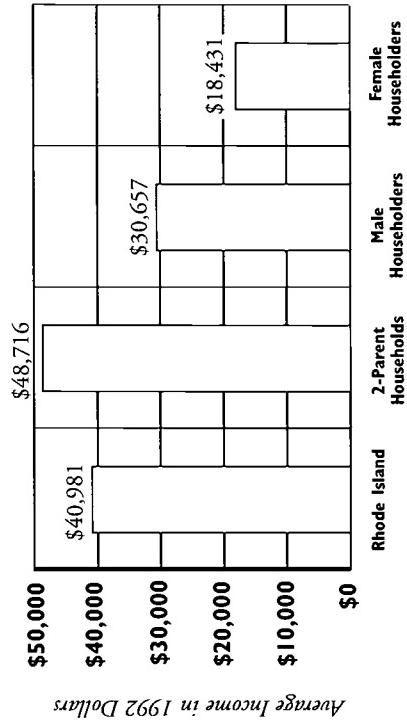

The median household income provides one measure of the ability of Rhode Island's families to meet the costs of food, clothing, housing, health care, transportation, child care and higher education. In 1993, one-half of all Rhode Island families with children earned less than \$35,040, and half earned more.

The manufacturing sector, which once provided relative prosperity for a broad middle class of unskilled and semi-skilled workers, is being replaced by a service economy. As the economy shifts to low paying jobs without benefits or higher paying jobs that demand advanced education and skills, it is  28

increasingly difficult for many families with children to make ends meet.

Wages and earnings at the lowest end of the labor market – primarily low-skilled workers – have collapsed over the past two decades. The hourly wage rate for a man with a high school degree has fallen in real dollars by about 35 percent since the early 1970s. A high school diploma only, without a college degree, no longer offers a path to economic security.

Average Household Income for Families with Children, Rhode Island, 1993

## Wages and Earnings in Decline Since the 1970's

Median Family Income of Young Families\* with Children by Educational Attainment of the Family Head, United States, 1973 and 1990 (in 1990 dollars)

	1973	1990	Percent Change
High School Dropout	\$18,842	\$10,213	-46%
High School Graduate	\$28,410	\$20,000	-30%
Some College	\$31,710	\$27,000	-15%
College Graduate	\$37,757	\$38,700	+3%

\*Young families are those headed by someone younger than 30.

## Child Support Affects Family Income

- ◊ The failure of an absent parent to pay child support has significant economic consequences for a parent raising a child or children alone. Even when there is a child support agreement in place, child support payments tend to be low and unreliable. Of absent parents under court order, only 39% make child support payments on time and in full.

◊ 83,459 Rhode Island children are currently in the State's Child Support Enforcement System. Of these, 20,785 Rhode Island children have not yet had paternity established and therefore receive no child support. Court orders for child support require the establishment of paternity.

◊ As of December 31, 1995, the amount past due on court ordered child support totaled \$190 million dollars. This figure does not include the potential additional \$56 million associated with the cases for which paternity had not yet been established.

# Children in Poverty

## DEFINITION

*Children in poverty* is the percentage of related children under age 18 who live in families with incomes below the poverty threshold, as defined by the U.S. Office of Management and Budget. "Related children" include the family head's children by birth, marriage, or adoption, as well as other persons under age 18, such as nieces and nephews, who are related to the family head.

## SIGNIFICANCE

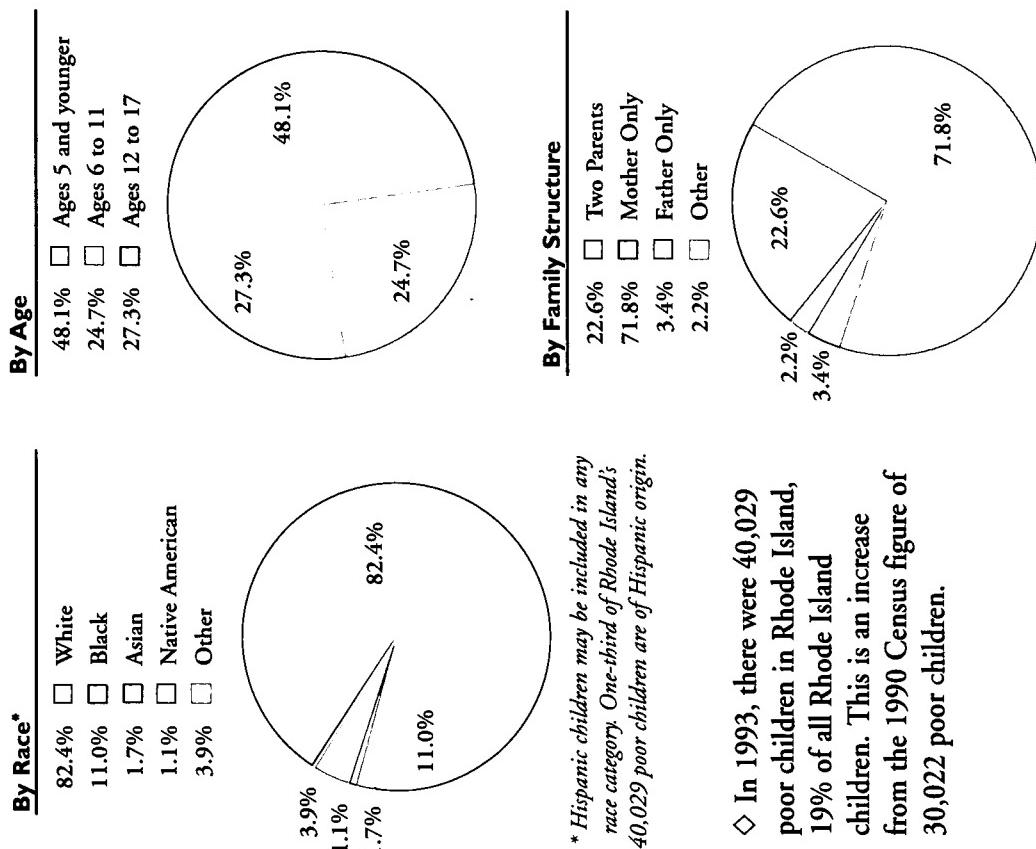

Children most at risk of not achieving their full potential are children in poverty, regardless of race. Poverty is related to every KIDS COUNT indicator. All aspects of child well-being — family, community, economic well-being, health, safety and education — are interrelated. The surrounding physical, social and economic environment plays a significant role in shaping child outcomes.

## DEFINITION

In 1995, the official federal poverty line for a family of four was \$15,150. Children who grow up in poverty are more likely to go without necessary food and clothing, live in substandard housing, be victims of crime and violence, lack basic health care, and have unequal access to educational opportunities. Poor children are more likely to be born low birthweight, die in infancy or childhood, have health problems that affect school performance, become a teen parent or drop out of school.

According to the 1990 Census, 68% of Rhode Island's poor children live in the five core cities of Providence, Pawtucket, Woonsocket, Newport, and Central Falls. In these communities, more than 15% of the children live in poverty — in Providence and Central Falls more than 30%, in Newport and Woonsocket more than 20%, and in Pawtucket more than 15%.

## Rhode Island's Poor Children, 1993

32

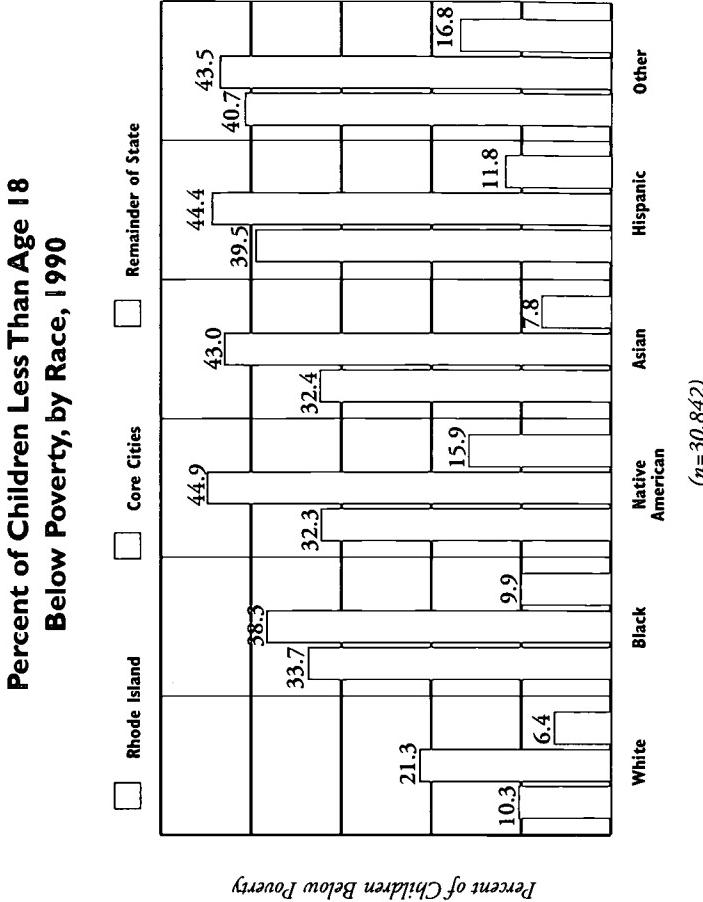

Source: U.S. Bureau of the Census, Current Population Survey, 1991-1995 average.

**Children in Poverty**

## **Childhood Poverty, Young Children Under Age 6, Rhode Island, 1993**

- ◊ Almost half of all poor children in Rhode Island are under age 6. In 1993, there were almost 20,000 poor young children in Rhode Island. This is an increase from the 1990 Census figure of 12,912 poor young children.
  - ◊ In 1993, one in four Rhode Island children under the age of six was living in poverty.

Source: 1993 data are estimates from the Current Population Survey 1991-1995 average.

**NOTE:** Percentages are calculated within each race or ethnic group.

- ◇ Two-thirds of Rhode Island's poor children are white, yet non-white children are more than three times as likely to be living in poverty.
  - ◇ Children who live in the core cities, regardless of race, are much more likely to be poor than children who live in other parts of the state. (Core cities are Providence, Pawtucket, Woonsocket, Newport and Central Falls.)

Source: U.S. Bureau of the Census, 1990 Census of the Population

# Children in Poverty

## Working Poor Families

◊ In 1993, thirty-eight percent of Rhode Island's poor children lived in families in which one or both parents work. Factors related to poverty among working families include the predominance of service and retail jobs that pay lower wages, the declining value of the minimum wage, and the inability to find full-time, year-round work.

◊ A person working 40 hours per week at the Rhode Island minimum wage of \$4.45 per hour will earn \$9,256 annually, about two-thirds of the 1995 poverty level income of \$15,150 for a family of four.

◊ The Rhode Island Community Food Bank reports that the number of working poor families seeking emergency food is steadily increasing. A national hunger survey conducted by the Food Research and Action Center in Washington, DC, indicates that almost half of hungry households have at least one full-time worker.

◊ According to the Institute for Women's Policy Research in Washington, DC, half of all single mothers in the U.S. who spend any time on welfare in a two-year period also work during that period, either combining work with welfare or cycling between work and welfare.

## Earned Income Tax Credit Helps Working Families

- ◊ The EITC is a credit on the federal income tax, available since 1975, to low-income and moderate-income working families with children. In 1994, the credit was extended to allow a small credit to very low-income workers without children. The EITC helps to bring minimum wage earners up to the poverty threshold (when combined with Food Stamps) and to promote work as a viable alternative to welfare.
- ◊ In 1995, the maximum benefit was \$2,040 for income-eligible families with one child. Income-eligible families with two or more children are entitled to a maximum credit of \$3,033. For families with incomes slightly above the poverty line, the credit decreases and is eventually reduced to zero for moderate-income families.
- ◊ According to the Internal Revenue Service, over 55,796 working Rhode Islanders received the federal EITC in 1994, totaling more than \$55 million. The EITC has provided an important supplement to the earnings of low-income Rhode Island workers affected by eroding wages.

# Children Receiving Public Assistance

## DEFINITION

*Children receiving public assistance* is the percentage of all children less than age 18 who were living in families enrolled in Aid To Families With Dependent Children (AFDC) and/or the Food Stamp Program on December 1, 1995.

These data measure the number of children and families participating in these programs at one point in time. They do not count the additional children and families who qualified for these programs at other points in the year but were not enrolled on December 1, 1995.

Children make up two-thirds of the AFDC caseload; families enrolled in AFDC have an average of two children. In December 1995, there were 40,789 children receiving benefits through AFDC.

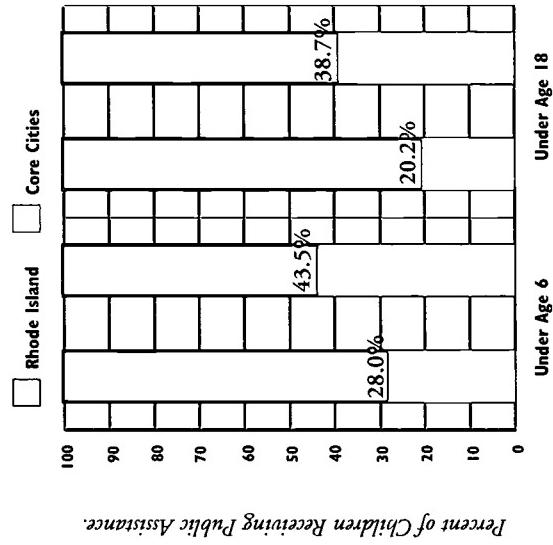

More than half of all Food Stamp beneficiaries in Rhode Island are children. There were 48,739 children receiving Food Stamps, including the 40,789 children enrolled in AFDC and almost 8,000 children living in working poor families not enrolled in AFDC.

The average monthly AFDC benefit for a Rhode Island family of three is \$554 per month. With an additional average of \$268 per month in Food Stamps, the average monthly combined benefit is \$822. This amount is 20% below the poverty line of \$12,590 for a family of three. Only 26% of families on AFDC receive housing assistance.

## SIGNIFICANCE

Income support programs such as AFDC and Food Stamps have a significant impact on the ability of poor families to provide food, shelter, and clothing for their children. While AFDC and Food Stamp benefits do not prevent a family from falling below the poverty line, they provide a minimal subsistence for poor families.

## Children Receiving Public Assistance, Rhode Island and Core Cities, December 1, 1995

- ◊ One in five Rhode Island children less than age 18 receives AFDC and/or Food Stamp benefits. In the core cities of Providence, Pawtucket, Central Falls, Woonsocket and Newport, more than one in three children less than age 18 receive public assistance.

# Children Receiving Public Assistance

## The Transition to Employment

AFDC is an income support program for 40,789 Rhode Island children, almost half of whom are under the age of six. Efforts to reform the welfare system require attention to the needs of these children, including family income for basic needs, such as food and shelter; access to health care; and quality child care.

### Families Receiving AFDC

- ◊ Families receiving AFDC are not an homogeneous group. Some receive benefits for extended periods of time and some require welfare assistance for a short period after an unexpected loss of earnings or family breakdown. Some cycle on and off welfare, periodically taking low-paying jobs that leave them financially insecure.
- ◊ According to the Rhode Island Department of Human Services, as of December 1995, 28% of the active AFDC caseload had received benefits for less than two years, 33% had received benefits for two to five years, and 39% had received benefits for five or more years. These numbers are cumulative, representing total time ever on AFDC, and include families on AFDC for a single period and others who have been on AFDC two or more times.
- ◊ Different educational backgrounds require different strategies to successfully enter the labor market and sustain employment. As of December 1995, 45% of AFDC heads of households had completed less than 12 years of education, 44% had completed 12 years of education, and 10% had completed more than 12 years.
- ◊ Federal and state efforts to reform the current AFDC system include linking welfare benefits to participation in the labor force. Barriers to sustainable employment for low-skilled workers include low wages, part-time, temporary or seasonal work, and non-traditional work shifts that make child care arrangements fragile.
- ◊ Women tend to obtain jobs that offer the least pay and the most insecurity. Women's earnings are below those for men in every occupational category for full-time, year-round workers. Women often have sole or primary responsibility for caregiving; the less families earn, the higher the proportion of income spent on child care.
- ◊ Women receiving AFDC have a wide range of employment histories. Having prior work experience, a high school diploma, and job training all increase the likelihood that AFDC recipients will find work. Sustainable employment requires jobs and supports that provide adequate resources for child care, health insurance, and transportation.

### Need For Quality Affordable Child Care

◇ Parents need good quality affordable child care in order to make a successful transition from welfare to sustained employment.

◇ Studies show that children in poor families are nearly one-third more likely to suffer either from delays in growth and development, a learning disability, or a significant emotional or behavioral problem. As a result, they have a greater need for more comprehensive and high quality child care services.

◇ As of December, 1995 there were over 18,000 children age five and under in families receiving AFDC, and over 15,000 children ages six to twelve.

◇ In Rhode Island as of December, 1995 there were 4,896 subsidized child care slots; 47% for employed, low-income families; 45% for participants in the AFDC job training program; and 7% for children in DCYF care. Sixty-eight percent of these subsidies paid for center-based care, 13% for care provided by relatives, 10% for family child care home slots, and 9% for in-home care.

◇ The safety and healthy development of children requires quality standards for the licensing and regulation of child care providers.

# Rent Burden

## DEFINITION

*Rent burden* is the percentage of median renter income needed to cover the average cost of rent, including heat, in a community. Generally, rent burdens over 30% are considered unaffordable.

rodent infestation, lead exposure, faulty wiring, inadequate heating systems, and unsanitary plumbing problems — threaten the health and development of children.

The shortage of affordable apartments and the dwindling number of housing subsidies has caused many Rhode Island families to “double-up”, resulting in overcrowded, unstable living conditions.

With a large percentage of family income going toward rent, any interruption in income or unexpected expense can place families at risk of homelessness. Periods of homelessness, or a rapid succession of moves due to an unstable living situation, have a negative impact on a child's education. Rhode Island educators, particularly in the core cities, report a rise in the number of students moving in and out of their school communities during the course of an academic year.

The shortage of safe, affordable housing has resulted in thousands of Rhode Island families living in substandard housing. Much of the state's rental housing stock is more than fifty years old, and many units are in need of repair. Serious housing and building code violations — including roach and

## Affordable Rents for Selected Family Income Levels

	Family of Three	Annual Income 1994	Affordable Rent (30% of Income)
Minimum WageEarner	\$ 9,256	\$231	
Poverty Level Family of Three	\$12,590	\$315	

In 1994, the average rent for a two-bedroom apartment in Rhode Island was \$581.

Source: Rhode Island Housing and Mortgage Finance Corporation, December, 1995.

## Homeless Children

According to the Rhode Island Emergency Shelter Information Project:

- ◊ 1,295 children under age 12 received shelter through Rhode Island's emergency food and shelter network from July 1, 1994 through June 30, 1995. Of these, 863 children were under age 5.
- ◊ Two-thirds of the children under age 12 were assisted at emergency shelters and one-third were assisted at domestic violence shelters.
- ◊ Deprived of the protection and stability a home provides, homeless children often suffer from illness and serious emotional distress, exhibiting short attention spans, withdrawal, aggression, speech delays and sleep disorders. They are more at risk for lead poisoning, asthma and malnutrition.

# The Island

They mowed the meadow down below  
Our house the other day  
But left a grassy island where  
We still can go and play

Right in the middle of the field  
It rises green and high;  
Bees swing on the clover there,  
And butterflies blow by.

It seems a very far-off place  
With oceans all around:  
The only thing to see is sky,  
And wind, the only sound.

- Dorothy Aldis

# Health

# Delayed Prenatal Care

## DEFINITION

*Delayed prenatal care* is the percentage of women beginning prenatal care in the second or third trimester of pregnancy or receiving no prenatal care at all. Data are reported by place of mother's residence, not place of infant's birth.

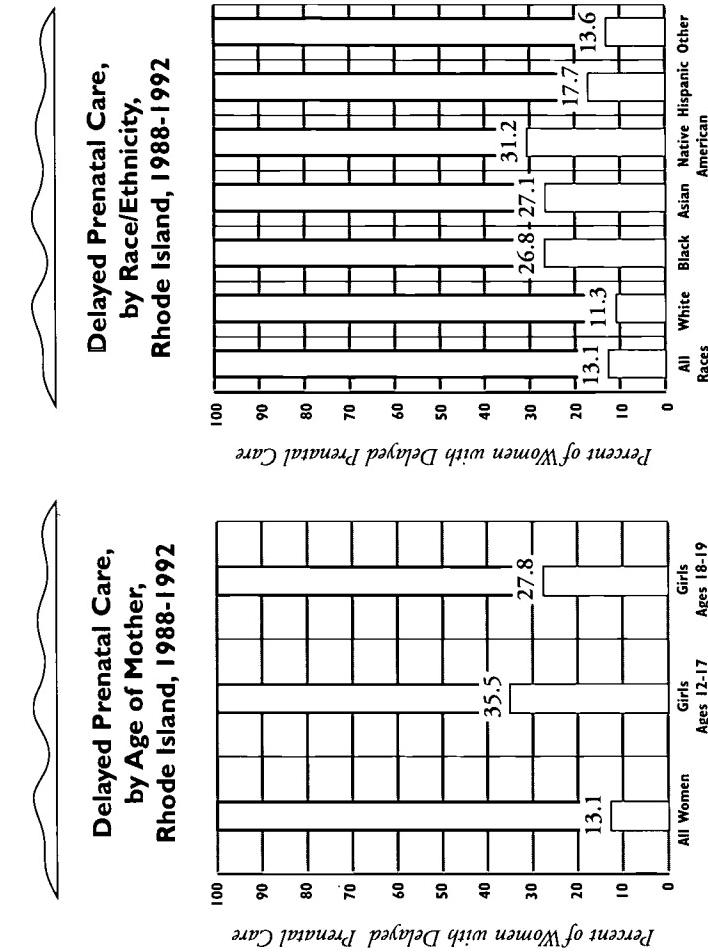

## Effective prenatal care also

screens for and intervenes with non-medical conditions including smoking, substance use, physical abuse, nutritional deficiencies, needs for food, clothing and shelter, and information needs related to infant and child development.

## SIGNIFICANCE

Timely and comprehensive prenatal care, focused on the whole family and the living environment, increases the likelihood of delivering a healthy infant of normal birthweight. Women who receive adequate prenatal care are more likely to get preventive care for their infants. Delaying the start of prenatal care to the second trimester increases health risks for both mother and baby.

Prenatal care offers the opportunity to screen for and treat disease conditions that increase the risk for poor birth outcomes.

◊ Early prenatal care is especially important for women at increased medical and social risk.

◊ Barriers to receiving care are greatest for poor, young, and minority women due to a lack of health insurance, transportation, and child care, and because of socioeconomic, language and cultural barriers within the health care system.

# Low Birthweight Infants

## DEFINITION

*Low birthweight infants* is the percentage of live births weighing under 2,500 grams (5.5 pounds). The data are reported by place of mother's residence, not place of infant's birth.

## SIGNIFICANCE

A baby's birthweight is a key indicator of newborn health and is directly related to infant survival, health and development.

Babies born weighing less than 5.5 pounds are at greater risk for physical and developmental problems. Babies born weighing less than 1,500 grams (3.3 pounds) are at especially high risk for chronic lung and respiratory problems, visual and hearing impairments, mental retardation, and developmental and learning disabilities.

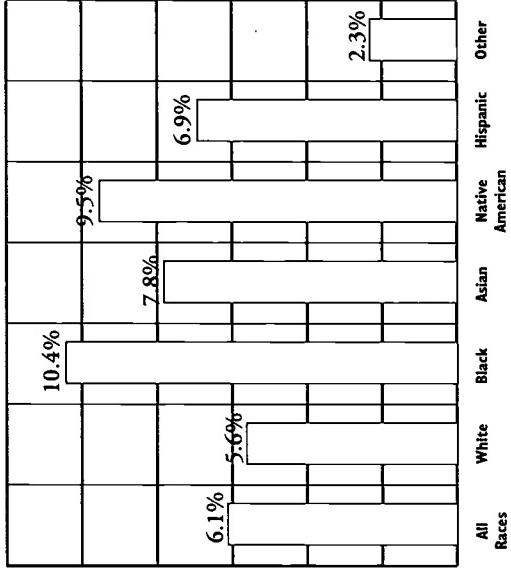

Almost 60% of infants who die in the first year of life were born with low birthweight. A baby is small at birth either because it was born too soon,

because it grew too slowly, or some combination of the two.

Prevention of low birthweight focuses on smoking cessation, adequate nutrition and weight gain, and comprehensive prenatal care. Smoking during pregnancy has been linked to 20% to 30% of low birth weight births.

Underlying the high rate of low birthweight among African-Americans in the U.S. is the higher rate of preterm delivery (babies born before 37 weeks gestation). The causes of preterm delivery are not well understood; the higher rates are not completely explained by differences in socio-economic status, health status and use of tobacco or other drugs.

## Low Birthweight Births by Race/Ethnicity, Rhode Island, 1988-1992

Percent Low Birthweight Infants

- ◊ Low birthweight rates for black infants are almost twice those for white infants, and are higher than those for other racial groups.

# Infant Mortality

## DEFINITION

*Infant mortality* is the number of deaths occurring to infants under one year of age per 1,000 live births. The data are reported by place of mother's residence, not place of infants birth.

## factors associated with infant deaths

include congenital birth defects, complications resulting from early delivery and low birthweight, and respiratory problems.  
In 1994, in Rhode Island 82 infants died before their first birthday.

## SIGNIFICANCE

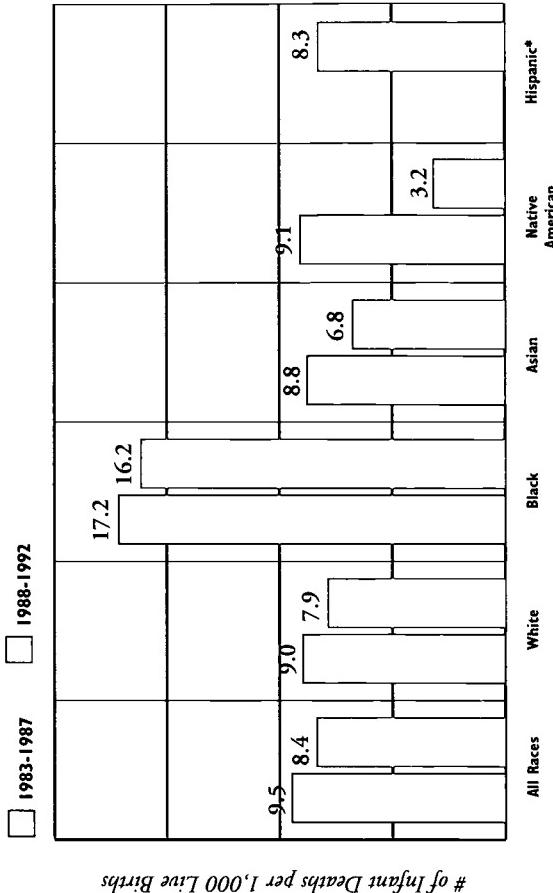

Infant mortality rates are closely linked to a community's social and economic conditions. Communities with multiple problems such as poverty, poor housing conditions, and unemployment tend to have higher infant mortality rates than more advantaged communities. In the United States, infant death is closely linked to low birthweight and preterm delivery.

Risk factors contributing to infant deaths include a lack of preventive health and prenatal care, inadequate nutrition and poor living conditions. Some of the health

## Higher Mortality Rate Continues Among Black Infants

- ◊ The overall United States infant mortality rate ranks twenty-second worldwide. The U.S. infant mortality rate for black infants ranks fortieth when compared with other countries overall rates.
- ◊ Over the past ten years, Rhode Island's black infant mortality rate has declined. Despite this progress, the black infant mortality rate continues to be twice that for white infants.

## Infant Mortality by Race/Ethnicity, Rhode Island, 1983-1992

\* Hispanic figures for 1983-1987 are not available.

*The State of the World's Children: 1994* (1994). New York: United Nations Children's Fund (UNICEF). Ranking is based on 1991 infant mortality statistics from the National Center of Health Statistics.

## DEFINITION

*Births to teens* is the number of births to teen girls ages 15 to 17 per 1,000 teen girls. Data are reported by the mother's place of residence, not the place of the infant's birth.

## problems, live in poverty and become teen parents themselves.

Youth who live in poverty, have poor basic skills or poor school attendance are at especially high risk for teen parenting. Both male and female teens are less likely to become teen parents when they have a range of positive life options and economic opportunities.

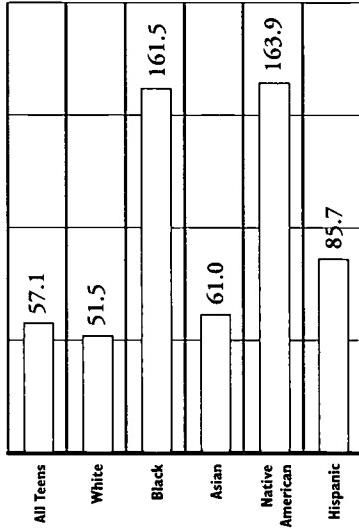

Too-early childbearing threatens the development of teen parents as well as their children. Teen mothers are less likely to obtain adequate prenatal care and are less likely to have financial resources and social supports needed for healthy child development.

Being a teen parent seriously limits subsequent education and employment prospects. Nationally, three out of five teen mothers drop out of school. Their lifetime earnings are less than half those of women who wait until age twenty before bearing their first child. Children born to teen parents are more likely to suffer poor health, experience learning and behavior

## SIGNIFICANCE

While teen pregnancy is clearly linked to basic academic skills and family income, the problem is more complex, as highlighted by the following U.S. information from The Alan Guttmacher Institute: 51% of births to girls ages 15 to 17 were fathered by men aged 20 or older; one survey of poor and pregnant teens conducted among Washington State's public health clinics revealed that two-thirds reported prior sexual abuse, usually by parents, guardians or relatives.

## Teenage Pregnancy, by Race and Ethnicity, Rhode Island, 1988-1992

*Teen Pregnancy Rate per 1,000 Teens Ages 14 to 18*

## Teenage Childbearing

- ◊ In Rhode Island in 1994, there were 1460 births to teens ages 13 to 19. Of these, 9 out of 10 were to unmarried teens.
- 37 babies were born to girls ages 13 and 14.
- 578 babies were born to teens ages 15 to 17.
- 845 babies were born to teens ages 18 and 19.

# Women and Children Receiving WIC

## DEFINITION

*Women and children receiving WIC* is the percentage of eligible women, infants and children served by the Special Supplemental Food Program for Women, Infants and Children (WIC).

## Women, Infants and Children Served By WIC, Rhode Island, December 1995

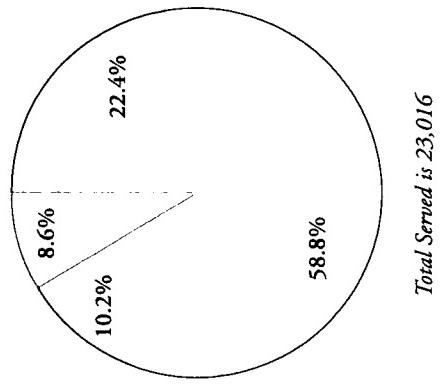

22.4%	<input type="checkbox"/> Infants
58.8%	<input type="checkbox"/> Children Ages 1 through 4
10.2%	<input type="checkbox"/> Pregnant Women
8.6%	<input type="checkbox"/> Postpartum Women

## SIGNIFICANCE

The Special Supplemental Food Program for Women, Infants and Children is a preventive program providing nutritious food, nutrition education and improved access to health care.

This federally funded program serves pregnant, postpartum and breast feeding women, infants and children less than five years of age. Participants must be at nutritional risk, based on abnormal weight gain during pregnancy, iron-deficiency anemia or other specified health risks. Household income must be below 185% of the poverty level.

In Rhode Island, the funded allocation of 26,000 can serve up to 80% of eligible women, infants and children.

## WIC Prevents Health Problems and is Cost-Effective

- ◊ WIC links the distribution of food to other health services, including prenatal care. Participation in WIC increases the likelihood that women will receive early, regular prenatal care and that their children will get regular pediatric care and immunizations. Mothers and children who are poor, minority, or poorly educated benefit most.
- ◊ WIC has been shown to protect infants and children from nutrition-related health problems during critical periods of growth and development. By protecting a child's cognitive development, WIC results in savings for special education that may have otherwise been incurred due to malnutrition in infancy and early childhood.
- ◊ The General Accounting Office has estimated that for every dollar spent on the WIC program, \$3.50 is saved in federal, state, and local government program benefits for the new child's first eighteen years. This is money saved from hospital care, special services, and special education.
- ◊ Low-income mothers participating in WIC have 25 percent fewer low birthweight babies and 44 percent fewer very low birthweight babies than mothers with similar incomes who were not on the WIC program. Every dollar spent on WIC has saved three dollars in perinatal Medicaid costs. The greatest cost-savings associated with the WIC program occur during the first year of life due to reduced medical costs.

# Children Receiving School Breakfast

## DEFINITION

*Children receiving school breakfast* is the percentage of public school children eligible for free or reduced-priced lunch who receive school breakfast. Half-day kindergarten, private schools and residential child care facilities are not included in the calculations.

## To receive a reduced-price meal,

household income must be below 185% of the federal poverty level.

For free lunches, household income must fall below 130% of poverty. Children in Food Stamp and AFDC households are automatically eligible for free lunches. In Rhode Island, 45,689 public school students receive free or reduced-price lunches.

## SIGNIFICANCE

Undernutrition during any period of childhood can have a detrimental impact on a child's cognitive development. The longer a child's nutritional needs go unmet, the greater the risk of cognitive impairment. The National School Lunch and School Breakfast Programs provide nutritious meals to children at participating schools. Meals must meet specific nutritional requirements to qualify for federal funds.

All Rhode Island schools make the School Lunch Program available to all students. Eligible students receive free or reduced-price meals.

76

## Breakfast Improves School Performance

- ◊ Children who participate in the School Breakfast Program have better school attendance, are more likely to arrive at school on time, and have higher standardized test scores than non-participants.
- ◊ In 1995, sixty-three percent of Rhode Island public school students eligible for free and reduced-price lunch attended schools offering school breakfast.
- ◊ The communities of Burrillville, Central Falls, and Providence offer the Breakfast Program to all students in the school district; Westerly and Woonsocket are also well-above the state average, with more than 80% of low-income students receiving breakfast in these school districts.
- ◊ There are 16,905 eligible low-income students who are not receiving school breakfast because they attend the 193 Rhode Island public schools that do not participate in the School Breakfast Program.

# Children with Lead Poisoning

## DEFINITION

*Children with lead poisoning* is the number of children confirmed with lead poisoning as of September 30, 1995. These data are for children age three, eligible to enter kindergarten in the Fall of 1997 (i.e. born between September 1, 1991 and August 31, 1992).

## SIGNIFICANCE

Childhood lead poisoning is one of the most common pediatric health problems and is entirely preventable. Infants and young children are most susceptible to the toxic effects of lead. Lead's effects on the developing central nervous system may be irreversible. Even low levels of lead exposure can result in learning disabilities, behavioral problems and lower I.Q. Higher levels of lead exposure can result in serious health problems and can lead to coma, convulsions and death.

While children of all backgrounds are at risk, low-income

children and children of color are particularly likely to be affected by lead poisoning. Inadequate nutrition and anemia, more common in poor children, increase a child's susceptibility to lead poisoning. Lead-based paint and lead-contaminated dusts and soils remain the primary sources of lead exposure for children. Living in substandard housing places children at risk for lead poisoning.

## Lead Poisoning of Rhode Island's Children

◊ Childhood lead poisoning is a multi-dimensional issue involving housing, nutrition, and health. Elimination of childhood lead poisoning will require continued efforts from both the private and public sectors, focused on preventing lead poisoning before it occurs. Living in substandard housing is a primary risk factor for lead poisoning in young children.

◊ Universal screening of all children under age 6 and medical treatment of lead-poisoned children remain critically important until the environmental sources most likely to poison children are eliminated.

◊ Twenty children in Rhode Island were hospitalized for severe lead poisoning in 1995. Of the twenty children hospitalized, 14 resided in Providence, and 15 were three years old or younger.

◊ Almost 1,100 children eligible to enter kindergarten in the Fall of 1997 had been confirmed with lead poisoning by September 30, 1995. Seventy-six percent of these children live in the core cities of Providence, Pawtucket, Woonsocket, Newport and Central Falls.

◊ This estimate of the number of lead-poisoned children age 3, eligible to enter the 1997 kindergarten class, is probably an undercount. Forty percent of children with elevated blood lead levels on initial screening have not yet had the repeat blood test needed to confirm the diagnosis of lead poisoning. It is likely that some of these children have lead poisoning.

# Children with Lead Poisoning

*Table 14.* Lead Poisoning in Children Entering Kindergarten in the Fall of 1997

# Children Without Health Insurance

## DEFINITION

*Children without health insurance* is the percentage of children under age 15 who were not covered by any kind of public or private health insurance, including Medicaid, during the previous calendar year. These data reflect only those who were uninsured throughout the entire year and do not include those who were uninsured for only part of the year.

## SIGNIFICANCE

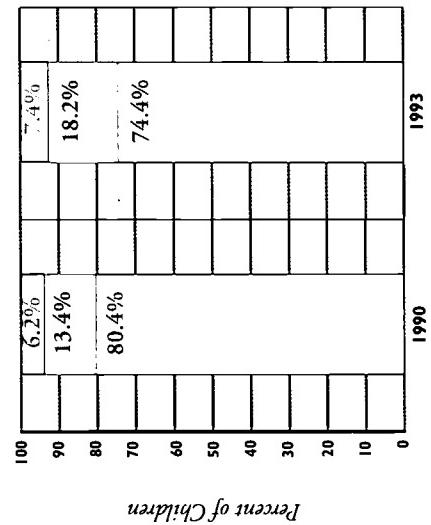

Access to primary health care is vital to every child's healthy growth and development. Uninsured children frequently lack access to primary and specialty care — including preventive care, comprehensive treatment for chronic and acute illness, mental health services, dental care, and prescriptions. Undiagnosed and untreated medical conditions can result in long-term health problems and interfere with learning and development.

Family income and a parent's employment-related insurance coverage are the most important

factors in determining whether children have health insurance and the type of coverage. Low-income children ages six and older whose families do not qualify for publicly-funded Medical Assistance are uninsured either because the parent's employer does not offer family benefits or because low wages preclude monthly payments for the more expensive family coverage plans.

In 1993, an estimated 7.4% of Rhode Island children under age 15 were uninsured for the entire year. Children whose parents cycle in and out of low-wage temporary jobs or seasonal work have intermittent health insurance coverage. According to a recent study in the Journal of the American Medical Association, it is estimated that, nationally, 22.6% of three-year-olds lack coverage for at least one month and 60% of those children lack coverage for at least six months or more.

## Children's Health Insurance Status, Rhode Island, 1990 and 1993

Source: Current Population Survey, 1988-1992 average and 1991-1995 average.

- ◊ Federal and state expansions of Medicaid eligibility between 1988 and 1994 have prevented an increase in the numbers of uninsured children, even with the declining trend in children covered through employer-related insurance.
- ◊ In Rhode Island, 80% of children under age 15 had coverage related to their parent's employment in 1990, but only 74% had employment-related coverage in 1993. The decline in employer-based coverage among children is due in large part to fewer employers offering or subsidizing health insurance plans that include coverage for dependents and fewer employees being able to afford family coverage.

- ◊ With current federal policy changes that set limits on total Medicaid expenditures, it is unlikely that public funding will continue to compensate for decreases in employer-related coverage. If current declines in employer-related coverage continue, increasing numbers of children will be uninsured.

### Facts about Rite Care

◇ Rite Care is Rhode Island's Medicaid managed care program. Started in 1993, Rite Care enrolled AFDC recipients in managed care. Rite Care expanded eligibility for Medical Assistance to include pregnant women up to 350% of poverty and children under age 6 up to 250% of poverty.

◇ Of the 70,436 Rite Care clients enrolled as of December 1995, 51% were enrolled in United Health Plans of New England; 30% in Neighborhood Health Plan of Rhode Island (community health centers); 12% in HMO Rhode Island; 6% in Harvard Community Health Plan of New England; and, 1% in Pilgrim Health Care.

◇ 58% of the 70,436 Rite Care clients are children receiving AFDC, approximately 10% are children not receiving AFDC but below 250% of poverty and their siblings.

### Notes on Table

All children listed as AFDC receive Medical Assistance through Rite Care. SSI includes children with disabilities receiving Medical Assistance. Other includes children enrolled in Rite Care who are not eligible for AFDC (children under age 6 up to 250% of poverty and children up to age 13 up to 100% of poverty and their siblings) and, children in state foster care who receive Medical Assistance.

# Additional Children's Health Issues

Rhode Island KIDS COUNT is dedicated to providing a comprehensive profile of the well-being of children in Rhode Island. However, there are some important issues affecting children for which there is a lack of available city and town data. Some of these critical health issues are as follows:

Children need to be immunized on schedule to guard against a variety of preventable illnesses. It is estimated that every dollar spent on immunization saves ten dollars in later medical costs. Efforts are underway in communities across the country to increase the number of fully-immunized children through neighborhood outreach programs that communicate directly with parents and provide easy access to immunization sites.

According to the National Immunization Survey conducted by the Centers for Disease Control between April and December, 1994, Rhode Island's immunization rate for two-year-olds has reached 82%, exceeding the national average of 75%.

---

**Reference**

*Health Care*, (Summer/Fall 1993). Los Altos: The Center for the Future of Children.

Access to dental care is a major obstacle confronting children from poor, working poor, and uninsured families. There is a shortage of private providers willing to accept Medical Assistance patients due to the low level of reimbursement for services. Only five community health centers in the state provide dental care, and all have waiting lists

between children in high risk communities and the rest of the state.\* These discrepancies appear as early as three months of age, widen by seven months, and persist throughout the first two years of life. Efforts to raise immunization rates include collaboration with the WIC program, assessment of immunization rates in individual practice settings, and the development of computerized tracking systems to remind parents and health care providers that an inoculation is due.

\**The high risk communities identified by the Department of Health for the retrospective survey were Central Falls, East Providence, Newport, Pawtucket, Providence, and Woonsocket.*

---

Past retrospective surveys conducted by the Rhode Island Department of Health reveal significant discrepancies in the completeness of immunizations

# Additional Children's Health Issues

## Children's Mental Health

Children's emotional well-being is essential to their growth and development. An estimated 12 to 15 percent of American children suffer from mental disorders. While the most frequent disorders treated include hyperactivity, attention deficit disorder and other conduct disorders, more than five percent of school-age children and adolescents suffer from depression and anxiety problems. Seventy percent of children with disorders do not access mental health services.

In Rhode Island, the eight Community Mental Health Centers provided services to a total of 4,285 children and youth during the 1994-95 fiscal year. Bradley Hospital, Rhode Island's largest psychiatric center for children and adolescents, admitted 660 children and youth to its hospital programs for the treatment of emotional disorders in fiscal year 1994-95. Butler Hospital admitted 400 children and youth.

Mental health professionals emphasize early intervention in order to keep children's emotional problems from intensifying. Children with mental health problems are found in all areas of children's services, including education, health, child

## Substance Abuse

Young people who abuse drugs and alcohol are more likely to drop out of school, become teen parents, experience injuries, and become involved with the criminal justice system.

A recent national survey of teenage drug use found that 21% of eighth graders said they had taken illicit drugs; more secondary students are using marijuana, LSD, hallucinogens, amphetamines, and inhalants each year.

Sixty-one percent of Rhode Island 12th graders surveyed by the RI Department of Health in 1993 reported that they had consumed an alcoholic beverage within the past month. Forty percent of high school seniors said they had used marijuana at some time in the past month.

The number of Rhode Island juvenile arrests for drug abuse violations in 1994 was the highest recorded total since 1977. Drug/alcohol offenses referred to Family Court increased 35% between 1994 and 1995, from 691 offenses in 1994 to 933 offenses in 1995.

# Child Deaths

## DEFINITION

*Child deaths* is the number of deaths from all causes to children ages 1 to 14, per 100,000 children. The data are reported by place of residence, not place of death.

or suicide). The three leading causes of injury deaths for children ages 1 to 14 were homicide, drowning, and motor vehicle collisions.

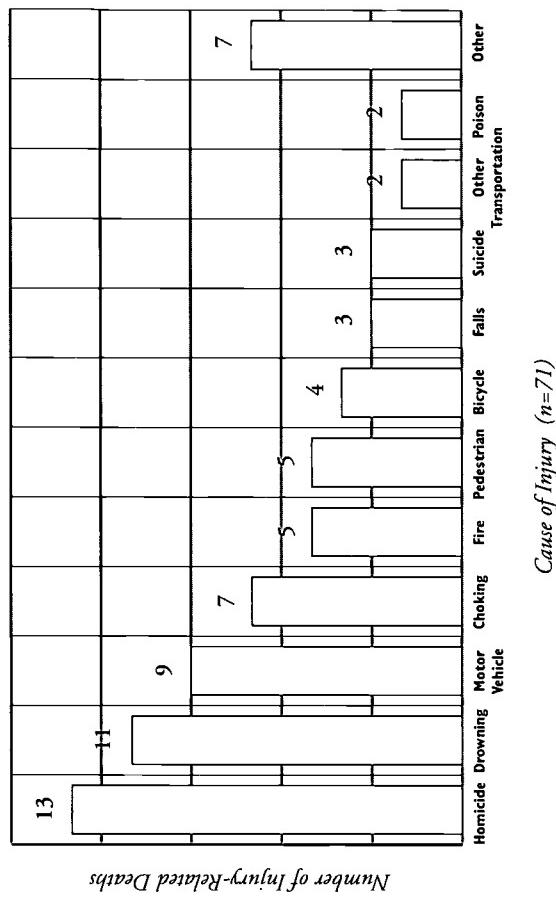

## SIGNIFICANCE

The child death rate is a reflection of the physical health of children, the dangers to which children are exposed at home and in the community, and the level of adult supervision children receive. Despite medical advances in prevention and treatment, the leading cause of death among Rhode Island children is illness. Of the 199 child deaths in Rhode Island between 1988 and 1992, 128 were due to illness.

Unintentional injuries are a leading cause of preventable death for children. Between 1988 and 1992, fifty-five deaths were due to unintentional injuries. An additional sixteen deaths were due to intentional injuries (i.e. homicide

36

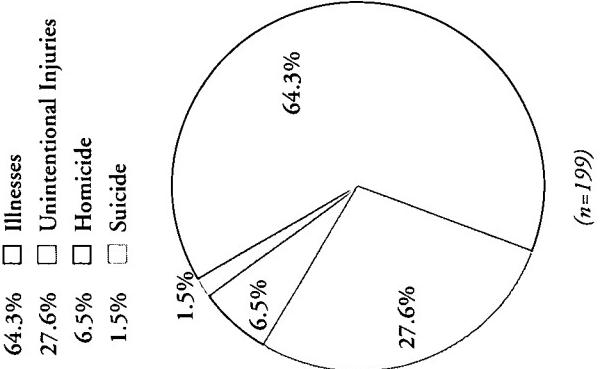

## Cause of Injury Deaths, Children Ages 1 to 14, Rhode Island, 1988 – 1992

*Cause of Injury (n=71)*

◇ The number of injury deaths is only a small part of the whole injury picture. For every death due to injuries, there are many more injuries that are untreated or require emergency room treatment or hospitalization. Many of the injuries that do not result in death leave children temporarily or permanently disabled, result in time lost from school, and decrease the child's ability to participate in activities.

## DEFINITION

*Teen deaths* is the number of deaths from all causes to teens ages 15 to 19, per 100,000 teens. The data are reported by place of residence, not place of death.

## SIGNIFICANCE

The transition to adulthood confronts teens of all ages with health and safety risks. Factors contributing to teen deaths include risk-taking behavior, the use of alcohol and drugs, and violence.

The leading cause of death among Rhode Island teens is unintentional injuries. Of the 170 teen deaths between 1988 and 1992, seventy-seven were due to unintentional injuries; almost two-thirds of these were due to motor vehicle collisions.

Suicide and homicide claimed the lives of 52 teens, accounting for almost one-third of all teen deaths between 1988 and 1992. It is estimated that for every successful suicide, there are between 50 and 200 unsuccessful known attempts.

According to the U.S. Department of Health and Human Services, gay and lesbian youth are two to three times more likely to attempt suicide than heterosexual young people.

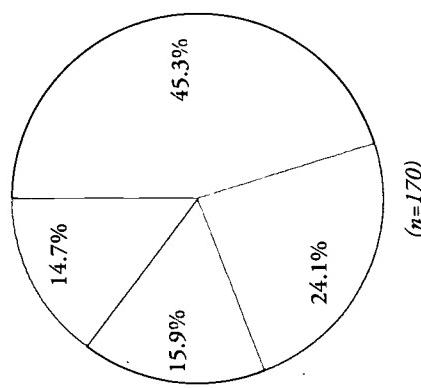

Thirty-percent of the completed youth suicides in the U.S. are committed by lesbian and gay youth.

The Annie E. Casey Foundation reports that while the rate of teen deaths due to unintentional injury, homicide, and suicide increased nationally between 1985 and 1992, Rhode Island's rate decreased 12%.

## Gun Violence and Youth

- ◊ In a recent national survey of 2,000 youths in grades 7 to 12 in public, private and parochial schools across the country, more than a third of the teens said they had seen or been involved in fights in which weapons were involved.
- ◊ In Rhode Island in 1993 and 1994, there were 15 gun deaths among teens ages 15 to 19. Thirty-seven children were hospitalized with gunshot wounds. Of these, two of the victims were younger than age six, 1 was between ages six and twelve, and 34 were teens ages 12 to 18. Eleven were intentional injuries, 22 were unintentional injuries, and 4 were of undetermined intention.

# Juveniles Referred to Family Court

## DEFINITION

*Juveniles referred to Family Court* is the percentage of juveniles ages 10 to 17 referred to Rhode Island Family Court for all wayward and delinquent offenses.

## SIGNIFICANCE

Risk factors for juvenile crime and delinquency include a lack of educational and job training opportunities, poverty, family violence, and inadequate supervision. Poor school performance, including chronic truancy and falling behind one or more grade levels, increases the likelihood of involvement with the juvenile justice system. Effective juvenile crime prevention programs involve all components of the community, including families, schools, law enforcement agencies, health care professionals, and community-based organizations. The Rhode Island Family Court has jurisdiction over all juvenile offenders referred for wayward and delinquent offenses. All referrals to

Family Court are from the state and local law enforcement agencies except for truancy cases which are referred by local school departments.

In 1995, in Rhode Island, 4,191 juveniles were referred to Family Court for a total of 9,802 offenses (one youth can be charged with multiple offenses). In all, 4.4 % of Rhode Island youths ages 10 to 17 were referred to Family Court at least once in 1995. These numbers do not include instances in which local law enforcement agencies refer a juvenile to a youth diversionary program or a city or town juvenile hearing board.

In 1995 the Attorney General's Office filed 34 motions for waiver of jurisdiction to try juveniles as adults. Twenty-eight of these waiver motions were granted; two are pending.

## Juvenile Wayward/Delinquent Offenses Referred to Family Court by Type, Rhode Island, 1995

	Property Offenses	Violent Crime Offenses
35%	Property Offenses	6%
13%	Status Offenses*	3%
13%	Simple Assaults	2%
10%	Drugs and Alcohol	9%
9%	Disorderly Conduct	Other

\*Status Offenses are acts that are age-related and would not be punishable if the offender were an adult, such as truancy and disobedient conduct.

n = 9,802

## Juvenile Offenses, Rhode Island, 1994 to 1995

- ◊ Drug/Alcohol offenses increased 35%, from 691 to 933.
- ◊ Arson offenses increased 64%, from 61 to 100.
- ◊ Violent crime offenses increased 4%, from 557 to 579.
- ◊ Weapons offenses decreased 27%, from 311 to 226.
- ◊ Possession of firearm on school property decreased 61%, from 18 to 7.
- ◊ Possession of weapons other than firearms decreased 26%, from 162 to 120.

104

## The Rhode Island Training School for Youth

- ◊ The Department of Children, Youth, and Families operates the Rhode Island Training School for Youth, the state's 176-bed residential detention facility for adjudicated youths and those awaiting trial.
- ◊ As of December, 1995 there were 185 youths at the Training School — 9 more than capacity; approximately 550 youth per year pass through the Training School. The average sentence is between six and twelve months.
- ◊ The Training School population ranges in age from 12 to 20; the average age is seventeen years; 92% of the residents are male, 8% are female.

◊ Over sixty percent of the Training School population is made up of ethnic/racial minorities, including 35% African-American, 20% Hispanic, 5% Asian, and 7% other. Thirty-three percent are White. Fifty percent of the Training School population is from Providence.

◊ The mean reading level of the total Training School population is fifth grade, sixth month; and the mean mathematics level is fourth grade, ninth month. The educational histories of the youth reflect brief stints in many different public schools.

◊ A survey of educational records of Training School youth conducted in November 1995 confirms significant academic difficulty in local schools. Based on 61 records reviewed, in the year prior to incarceration, 4 youths had passing grades, 2 youths had mixed passing and failing grades, and 55 had all failing grades or no grades at all.

Sources: *Evaluation of Educational Services Provided for Incarcerated Juveniles*, RI Council on Vocational Education, April, 1995; *Report of the Special Master to the Rhode Island Training School for Youth Educational Program*, December 19, 1995; Rhode Island Training School for Youth, Youth Career Education Center.

## Youth Rehabilitation Services

- ◊ After a law enforcement agency refers a juvenile to Family Court, a determination is made whether further court action should be taken or whether the youth should be referred to a diversion program. Juvenile diversion options include community service, restitution, mental health or substance abuse counseling, and/or a community-based youth diversionary program.
- ◊ Approximately 31% of all cases referred to Family Court are diverted instead of proceeding to a formal court hearing. Current community-based diversion/rehabilitation openings are limited. Specialized community-based placements are often unavailable for youth who need them.
- ◊ A 1994 National Law Journal survey of Family Court judges found that 84% desire a greater range of rehabilitation options for juveniles who appear before them. Three-quarters of the judges said that well-financed, quality rehabilitation programs could reclaim all but 10% of the youths.

# Child Abuse and Neglect

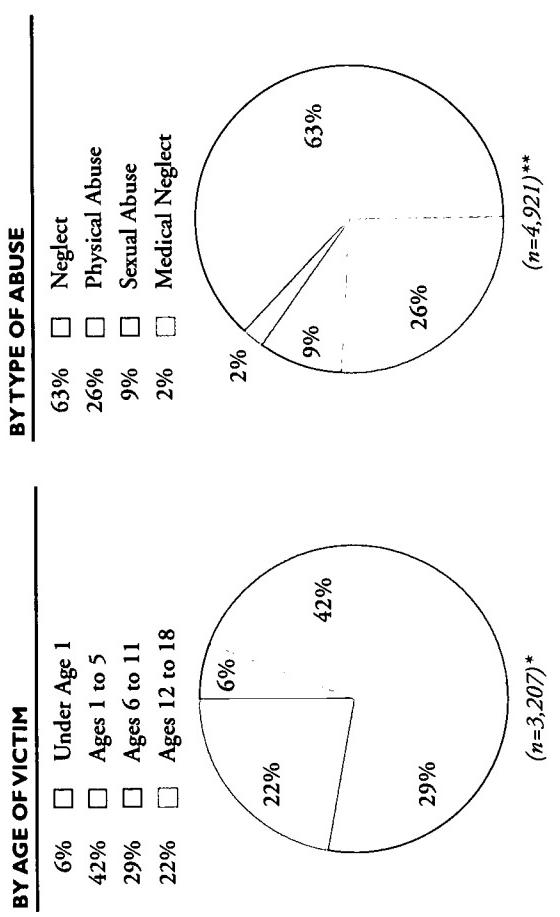

**DEFINITION**

*Child abuse and neglect* is the total number of indicated cases of child abuse and neglect per 1,000 children. "Indicated case" means that credible evidence exists that child abuse and/or neglect occurred following an investigation of an abuse report. An indicated case can involve more than one child. Child abuse includes physical, sexual, and emotional abuse. Child neglect includes physical and emotional neglect.

Child maltreatment can result in death, permanent disability, delayed development, mental and behavioral disorders, depression, and suicide. It is also linked to poor academic performance, juvenile delinquency, and teenage pregnancy.

In Rhode Island in 1995, there were 2,781 indicated cases of child abuse and neglect, a rate of 9.9 per 1,000 children. More than 50% of indicated cases involved children from the core cities of Providence, Pawtucket, Woonsocket, Newport, and Central Falls.

## Indicated Cases of Child Abuse and Neglect, Rhode Island, 1994

## SIGNIFICANCE

Children may suffer from child abuse regardless of their racial or ethnic background or socio-economic status. Children are at increased risk for maltreatment if their parents or caregivers are experiencing multiple problems such as drug and alcohol abuse, mental illness, emotional stress, poverty, unemployment, or domestic violence.

## BY RELATIONSHIP OF PERPETRATOR TO VICTIM

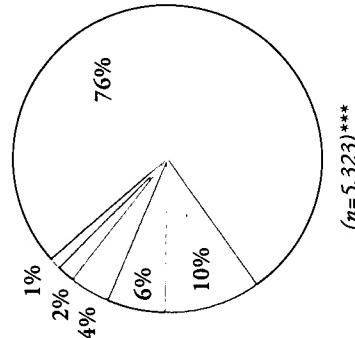

76%	<input type="checkbox"/> Parents
10%	<input type="checkbox"/> Relatives/Household Members
6%	<input type="checkbox"/> Unknown
4%	<input type="checkbox"/> Child Day Care Providers
2%	<input type="checkbox"/> Foster Parents
1%	<input type="checkbox"/> Residential Facility Staff

Notes on Pie Charts

\* The number of victims is higher than the number of indicated cases. One indicated case can involve more than one child victim. Data reflect an unduplicated count of child victims.

\*\*This number reflects maltreatment events, not children. Children often experience more than one type of abuse. For example, if a child were physically and sexually abused, two maltreatment events would be counted.

\*\*\*Perpetrators can abuse more than one child and can abuse a child more than once. The total number of perpetrators in 1994 was 3,244 and they carried out 5,323 incidents of abuse and neglect.

# Child Abuse and Neglect

## Facts About Child Abuse in Rhode Island, 1994

- ◊ 3,207 children were victims of child abuse and neglect.
- ◊ 48% of child abuse and neglect victims were under age 6, including 204 infants under age one.

\* Based on R.I. Department of Children, Youth, and Families determination of death due to child abuse or neglect by parent or caretaker.

- ◊ 51% of the victims of child abuse and neglect were female, 49% were male.
- ◊ 76% of perpetrators were parents of the victims.

## Rhode Island

### Child Deaths Due to Child Abuse and Neglect\*

YEAR	NUMBER OF DEATHS
1990	4
1991	7
1992	4
1993	3
1994	5

## The Impact of Violence in the Home On Children

- ◊ It is estimated that nationally between 3 and 10 million American children annually witness domestic violence; 87% of children in homes with domestic violence witness that abuse.
- ◊ The impact of children's exposure to domestic violence can cause psychological harm. In addition to fearing for their own and their mother's safety, children often experience self-blame. Exposure to such trauma can also limit cognitive development and the ability to form close attachments.
- ◊ The rate of child abuse is significantly greater for children in homes with spousal battery (husband to wife). A review of research on the relationship between domestic violence and child abuse indicates that up to 50% of the children in these violent homes are themselves abused.
- ◊ A recent study conducted by the Probation Department of the State of Massachusetts found that 43,000 children per year are exposed to domestic violence in Massachusetts. Sixty-five percent of the children are eight years old or younger.

Sources: American Bar Association Center on Children and the Law, *The Impact of Domestic Violence on Children* (1995); The National Health and Education Consortium, *Hidden Casualties: The Relationship Between Violence and Learning* (1995); The Boston Globe, October 12, 1995; R. Gelles, "Violent Families: The Relationship Between Child Abuse, Wife Abuse, and Other Forms of Family Violence" (1991); and L. Turry, "Research Connections Between Spouse Abuse and Wife Abuse" (1995).

# Child Abuse and Neglect

## DCYF Caseload:

On December 1, 1995 the total active caseload of the Rhode Island Department of Children, Youth and Families was 7,760 children. This does not count the 1,954 children in pending child abuse and neglect investigations or the 994 children enrolled in DCYF community-based programs.

## Children in Out-of-Home Placements

- ◊ The most frequent reasons children are removed from their homes are neglect, lack of supervision, sexual abuse and physical abuse, and incapacity of the parent. Increasingly, parental abuse of alcohol and illegal drugs are contributing factors leading up to the need for substitute care. Some children are in out-of-home placements because they represent a danger to themselves, their families, or their communities.
- ◊ Out-of-home placements include non-relative foster homes, relative foster homes, specialized foster homes, relatives, group homes, shelter care, residential treatment, and medical facilities. As of December 1995, 2,999 Rhode Island children under the care of DCYF were in out-of-home placements. An additional 1,280 children were involved with subsidized or non-subsidized adoptions, and 119 were classified as unauthorized adoptions, and 119 were classified as unauthorized absence/runaways.
- ◊ Night-to-night placements refer to the temporary nightly placement of youths under the care of DCYF who are awaiting a permanent foster care placement or a group home/ treatment placement or who have run away from their current placement. During the month of December, 1995, an average of 18 youths per week were in night-to-night placements.

## Foster Homes

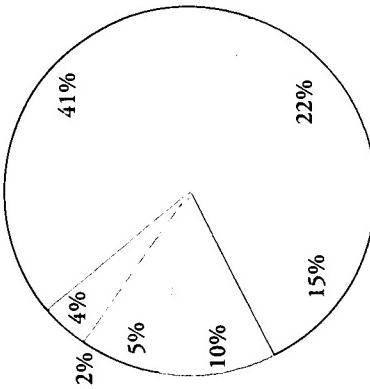

- ◊ In Rhode Island as of December 1995, there were 1,679 children living in foster homes: 55% in non-relative foster homes, 38% in relative foster homes, and 7% in specialized foster homes (which provide specialized care to children with special medical needs).
- ◊ As of December 1995, there were 604 licensed foster homes providing non-relative foster care; 356 certified relative foster homes, and 136 homes pending licensure or certification.

## Residential Care

- ◊ An increasing number of children entering relative and non-relative foster homes have significant emotional, behavioral and medical needs, including developmental delays, low birth weight, heart problems, AIDS, and health problems due to prenatal drug exposure. The complex needs of the children require adequate support for foster parents and a comprehensive array of services and supports in the community.
- ◊ As of December 1995, 398 young people in DCYF care were in residential treatment, 133 were in group homes, and 130 were in independent living situations.

## Notes on Table

An indicated case is an investigated report of child abuse and neglect for which credible evidence exists that child abuse and/or neglect occurred. An indicated case can involve more than one child.

## Source of Data for Table

Data are from the State of RI Department of Children, Youth and Families, Child Abuse and Neglect Tracking System, number of reports (indicated cases) for the period January 1, 1995 to December 31, 1995. Population data are from US Bureau of the Census, 1990 Census of Population.

## DEFINITION

*Child care* is the number of full-time licensed child care center slots and certified family child care home slots.

## SIGNIFICANCE

The increasing proportion of women in the labor force has resulted in significant numbers of children who need child care in their earliest years. Many two-parent families need two incomes to make ends meet; one quarter of all working women are sole wage-earners for their children. In Rhode Island, 61% of mothers with a youngest child under age 6 are in the labor force.

Young children need safe, nurturing, developmentally appropriate child care. School-age children fare best if they have after-school supervision, programmed activities, and the attention of caring adults. Research points to a relatively low supply of quality child care for infants, school-age children, children with disabilities and special health care needs, and parents with

unconventional or shifting work hours.

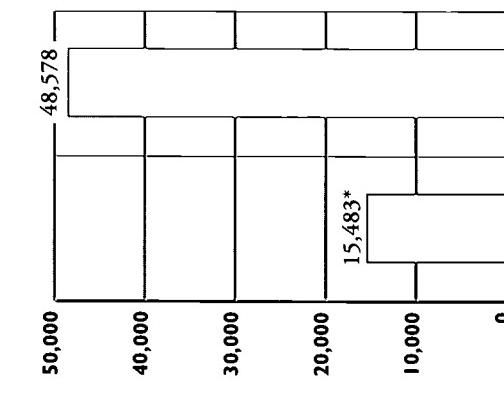

In Rhode Island, a shortage of child care options leaves many families unable to find safe, affordable, good quality child care for their children.

## Quality Child Care for Young Children

◊ The single most important factor in quality child care is the relationship between the child and the caregiver. This relationship depends on the ratio of caregivers to children, the education and training levels of the caregivers, and the consistency of staff and care.

◊ A quality child care program also attends to basic issues of health and safety, and emphasizes a partnership between parents and caregivers. Two recent national studies of both center care and family child care found that significant numbers of children in child care programs are receiving mediocre or poor quality care.

## Licensed Child Care for Children Under Age 6, Rhode Island, 1995

Full-time Licensed Child Care Center and Certified Family Child Care Home Slots  
 Children Under Age 6 With Mother in the Labor Force Full- or Part-time

\*Does not include part-time child care center slots and informal child care arrangements.

## School Age Child Care

◊ School age child care refers to formally organized care for 5 to 13 year olds that occurs before and/or after school during the academic year and all day during the summer and vacation periods.

◊ The beneficial effects of organized school-age child care programs include more highly developed social skills, and improved reading and math scores. Research suggests that self-care can lead to increased susceptibility to peer pressure and higher levels of fear, isolation, and loneliness.

◊ Although the exact number of children in self-care is uncertain, the Census Bureau estimates that nationally about 4.6 million school-age children are in self-care (defined as being alone 25 hours or more weekly).

◊ In Rhode Island, as of November 1995, there were 5,750 licensed school-age child care slots.

### Notes on Table

Potential number of children less than age 6 is based on the number of children under age 6 multiplied by the percentage of women in the labor force. These data are from the 1990 Census of the Population. Number of child care slots is the number of licensed full time child care center slots for children under age 6, and the number of slots in certified family child care homes, as of November 1995. These numbers do not include part-time child care center slots and informal child care arrangements.

### Source of Data for Table

Percentage of women in the labor force is based on US Bureau of the Census, 1990 Census of Population. All other data are from Options for Working Parents, Greater Providence Chamber of Commerce, and the RI Department of Children, Youth and Families.

# Children Enrolled in Head Start

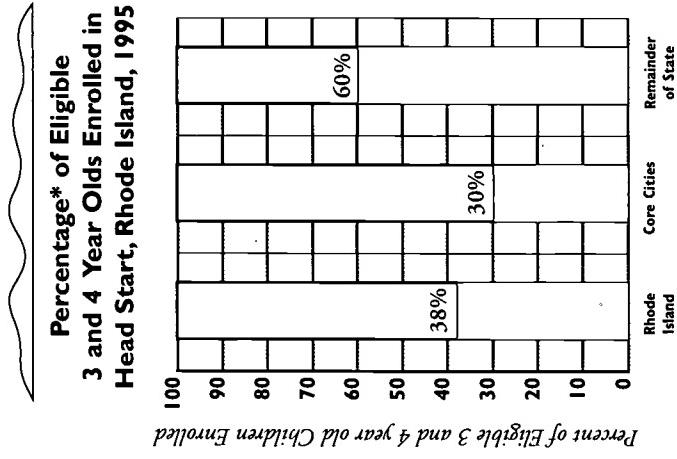

**DEFINITION**  
*Children enrolled in Head Start* is the percentage of eligible 3 and 4 year old children enrolled in the Head Start preschool program as of October 1, 1995.

**SIGNIFICANCE**

Head Start is a comprehensive early childhood development program for low-income preschool children, primarily ages three to five, and their families. Children living in families with incomes below 100% of the Federal poverty line are eligible for Head Start. Up to 10% of the children can have a family income above the poverty line, especially if the child has a special need.

Head Start program components include education, parent involvement, social services, health and nutrition, and mental health. The program is designed to provide low-income children with the socialization and school-readiness skills they need to enter public schools on an equal footing with more economically advantaged children.

In Rhode Island, 2,379 children are enrolled in Head Start, 38% of eligible 3 and 4 year olds. Of the core cities, only Newport and Woonsocket have at least 38% of eligible children enrolled. Pawtucket and Central Falls have less than 13% of eligible children enrolled.

\* Percentages of eligible children enrolled are overestimates because eligible poor children not enrolled in AFDC are not included in the calculations. Core cities are Providence, Pawtucket, Woonsocket, Newport and Central Falls.

## Quality Early Childhood Programs Enhance School Success

◇ Many factors contribute to a child's success in school. School readiness is based on children's physical health, self-confidence and social competence. Readiness is not determined solely by the innate abilities and capacities of young children. Readiness is shaped and developed by people and environments in the early childhood years.

◇ Children most at risk of school failure are those most likely to benefit from quality pre-school programs. The Committee on Economic Development reported in 1991 that for every dollar spent on a comprehensive and intensive pre-school program for the disadvantaged, society saves up to \$6 in the long-term costs of welfare, remedial education, teen pregnancy and crime.

◇ According to a 1993 report issued by the Government Accounting Office about 35% of all poor three and four year olds participate in a pre-school program compared to 60% of the highest income three and four year olds.

◇ Low-income children enrolled in comprehensive pre-school programs like Head Start are less likely to fail a grade, less likely to require special education or remedial education, and more likely to finish high school.

## DEFINITION

*Fourth-grade reading skills* is the percentage of fourth-grade students who scored at the 40th percentile or higher on the Metropolitan Achievement Test (MAT) in 1994, considered a "basic" standard in terms of national norms. Scores are from the Reading Comprehension subtest and are based on the 1992 national norms.

## SIGNIFICANCE

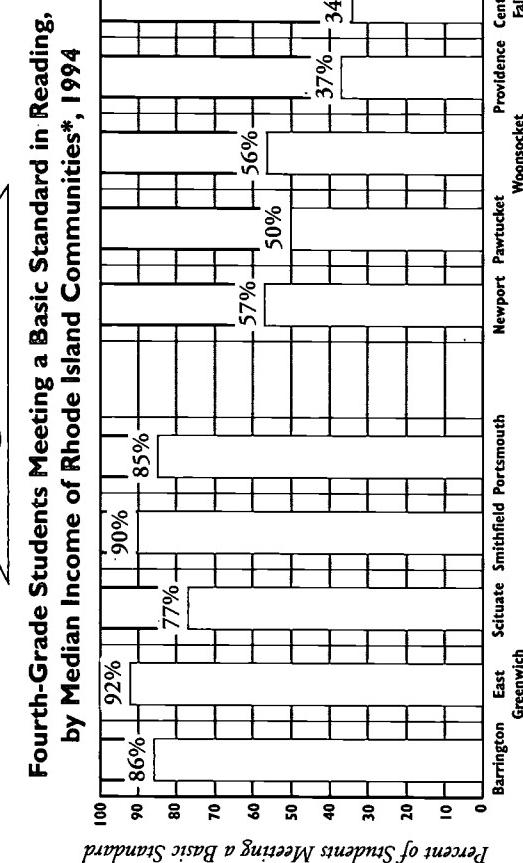

Reading skills are critical to a student's success in school and in the workforce. Students who cannot read are more likely to be absent from school and to exhibit behavior problems and low self-esteem. Students need high quality instruction and the necessary resources to achieve high performance standards in reading. Parents of all educational backgrounds and income levels can play a significant role in shaping students' reading abilities by the

reading practices and attitudes that they convey at home. According to the National Education Goals Panel, children who report that they regularly read for fun on their own time consistently outperform students who read only what is required of them at school. Children who regularly discuss their reading with family and friends score significantly higher in reading than students who report that they rarely or never do so. Student reading proficiency declines as television viewing increases. Nationally, one out of every five fourth graders watches six or more hours of television daily.

- ◊ Demographic variables, such as parent education and the socioeconomic status of the community, are strong predictors of student achievement in reading.

- ◊ Achievement test scores are only one measure of a child's reading ability. These standardized tests need to be supplemented with a broader range of measures that are less subject to culture and gender bias.

Sources: *Reaching for High Standards: Student Performance in Rhode Island, 1994* (February 1995). Providence: Department of Elementary and Secondary Education; *Wasting America's Future* (1994). Washington, DC: The Children's Defense Fund.

\*The five communities in Rhode Island with the highest median household income are Barrington, East Greenwich, Scituate, Smithfield and Portsmouth. The five communities in Rhode Island with the lowest median household income are Newport, Pawtucket, Woonsocket, Providence and Central Falls. Rhode Island median household incomes in 1990 ranged from a high of \$53,058 in Barrington to a low of \$18,617 in Central Falls.

## Notes on Table

Percent of 4th grade students meeting a basic standard in reading according to the 1994 Metropolitan Achievement Tests, Rhode Island School Districts, 1994. Core cities are Providence, Pawtucket, Central Falls, Woonsocket and Newport.

## Source of Data for Table

Percent of children living in poverty is based on U.S. Bureau of the Census, 1990 Census of Population. All other data are from the Department of Elementary and Secondary Education, *Reaching for High Standards: Student Performance in Rhode Island, 1994*, unless otherwise indicated.

# High School Graduation Rate

DEFINITION	Children and teens in economically disadvantaged communities and whose parents have little formal education are more likely to drop out of school. Early warning signs for a student likely to drop out of school include inability to read at grade level, poor grades, frequent truancy, behavior problems, substance abuse, and teen pregnancy. Eighty-two percent of Rhode Island students enrolled in ninth grade in the Fall of 1994 are expected to graduate from high school.	<b>Factors Influencing School Achievement</b> <ul style="list-style-type: none"><li>◊ Achievement differences among school districts, and among schools within a district, are correlated with the socio-economic status of the community or neighborhood. There are currently major contrasts in educational achievement and student outcomes depending on where a student lives and goes to school.</li><li>◊ Schools in low-income communities have more limited access to up-to-date instructional materials, adequate classroom space, well-equipped libraries, laboratories, computers and after-school sports and cultural activities.</li><li>◊ Many children of color not only attend schools with fewer resources, but may also be confronted with low expectations. Research shows minority students are disproportionately assigned to special education classes and steered toward vocational education.</li><li>◊ Students can benefit from access to a broad range of community supports that address academic issues, health problems, inadequate nutrition, neighborhood and family violence, and other factors that can disrupt school performance.</li></ul>
<b>SIGNIFICANCE</b>	Children who receive a quality education are more likely to grow into capable, self-sufficient adults who contribute to their communities. With the decline in manufacturing and the increased reliance on an information-based economy, education has become critical to a young person's success in the labor market. # Teens Not in School and Not Working

## DEFINITION

*Teens not in school and not working* is the percentage of teens ages 16 to 19 who are not enrolled in school, not in the Armed Forces, and unemployed. This indicator includes recent high school graduates who are unemployed, and teens who have dropped out of high school who are jobless.

## SIGNIFICANCE

Teens who lack the opportunities that accompany strong skills, educational attainment, and prospects for success in the labor market are unlikely to realize their full potential. Gaps in schooling and lack of workforce preparation can place teens at a significant disadvantage as they transition from adolescence to adulthood.

There are significant barriers for teens with low-skills and minimal education to move out of the minimum wage labor market as they enter early adulthood. Low-skills and low-wages make it difficult for young men and women to support

families at a standard of living above the poverty line.

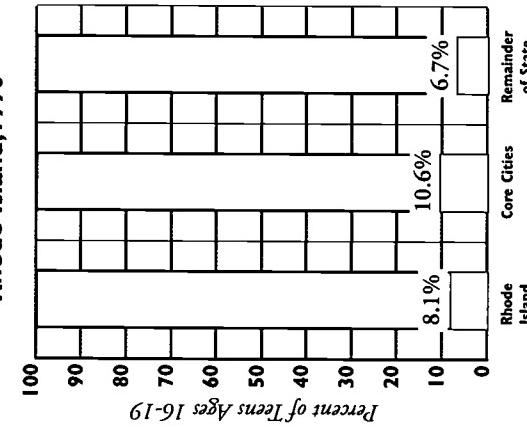

Rhode Island ranks well compared to the rest of the country in the number of teens not in school and not working. However, there continues to be a significant gap between the core cities and the remainder of the state.

In 1990, eight percent of youth ages 16 to 19 were not in school and not working.

## School-to-Work: Building Skills for Workforce Participation and Advancement

- ◊ School-to-work programs aim to systematically construct a bridge from education to employment. They recognize that students learn better and perform more competently in the context of solving real-world problems. Effective school-to-work programs provide career guidance that begins early in the youth's school experience and continues throughout high school.
- ◊ The most effective of the current generation of school-to-work programs show positive effects on attitudes toward work, school attendance and drop-out rates. However, many school-to-work efforts do not adequately address the needs of students on the verge of dropping out of school and out-of-school youth.

## Percent of Teens Not In School and Not Working, Rhode Island, 1990

# Acknowledgements

and

# Methodology

The 1996 Rhode Island KIDS COUNT Factbook provides data for twenty-three indicators of child well-being. The data are presented in three different ways:

## NUMBERS

The most direct measure of the scope of a problem is the count of the number of events of concern during a specified time period - e.g. the number of child deaths between 1988 and 1992.

Numbers are important in assessing the scope of the problem and in estimating the resources required to address a problem.

Numbers are not useful to compare the severity of the problem from one geographic area to another or to compare the extent of the problem in your state with national standards. For example, a state with more children might have more low birthweight infants due to the larger number of total births, not due to an increased likelihood of being born low birthweight.

## RATES AND PERCENTS

A rate is a measure of the probability of an event - e.g. out of every 1,000 live births, how many infants will die before their first birthday?

A percent is another measure of the probability of an event - e.g. out of every 100 births, how many will be born low birthweight?

Rates and percents take into account the total population of children eligible for an event and therefore, are useful in comparing the severity of the problem from one geographic area to another, to compare with state or national standard or to look at trends over time.

## LIMITATIONS

In any data collection process there are always concerns about the accuracy and completeness of the data being collected. All data

used in the 23 indicators were collected through the U.S. Bureau of the Census and through routine data collection systems operated by different agencies of the state of Rhode Island. We do not have estimates of the completeness of reporting to these systems.

In all cases, we used the most reliable data currently available. For census-based indicators, statewide numbers have been updated to 1993 using the current Population Survey, 1991-1995 average. The Current Population Survey does not provide data at the level of city and town. City/town tables, therefore, use information from the 1990 Census of Population.

We expect that over time the data used to assess child well-being in Rhode Island will be more timely and will contain more complete information on the state's racial and ethnic communities than is currently available.

## SOURCES OF DATA AND METHODOLOGY FOR CALCULATING RATES AND PERCENTS

For each indicator, the source of information for the actual number of events of interest (the "numerator") are identified within the Definition and Notes to Table sections for each indicator.

For each indicator that uses a rate or a percent, the following outlines the methodology used to estimate the total number of children eligible for the indicator of interest (i.e. the "denominator"). Rates and percentages were not calculated for cities and towns with denominators less than 500, as rates and percentages for small denominators are statistically unreliable. "NA" is noted in the indicator table when this occurs. In the indicator for child deaths and teen deaths, the indicator events are rare; in these instances, city and town rates are not calculated, as small numbers make these rates statistically unreliable.

**Child Population, Children in Single Parent Families, Children in Poverty.** The denominator is the number of children under age 18 according to the 1990 Census of Population.

**Children Receiving Public Assistance.** The denominator is the number of children ages one to thirteen according to the 1990 Census of Population, plus the four times the average number of births for the years 1988 to 1992.

**Delayed Prenatal Care, Low Birthweight Infants, Infant Mortality.** The denominator is the total number of live births to Rhode Island residents from 1988 to 1992.

**Births to Unmarried Teens.** The denominator is the number of girls ages 15 through 19 according to the 1990 Census of Population, multiplied by five to compute a rate over five years, 1988 to 1992.

**Teen Deaths.** The denominator is the number of teens ages 15 to 19 according to the 1990 Census of Population, multiplied by five to calculate a rate over five years, 1988 to 1992.

**Juveniles Referred to Family Court.** The denominator is the number of children ages 10 to 17 according to the 1990 Census of Population.

**Child Abuse and Neglect.** The denominator is the number of children under the age of 21 according to the 1990 Census of Population.

**Children Enrolled in Head Start.** The denominator is the number of children ages 3 and 4 who lived in families receiving AFDC on December 1, 1995. This is an underestimate of children eligible, because it does not include children eligible for Head Start who live in non-AFDC families living below the poverty line.

**High School Graduation Rate.** The denominator is the number of children enrolled in 9th, 10th, 11th and 12th grades in the Fall of 1993.

**Teens Not in School and Not in the Labor Force.** The denominator is the number of teens ages 16 to 19 according to the 1990 Census of Population.

The 1996 *Rhode Island KIDS COUNT Factbook* was made possible by the efforts of many dedicated individuals. Rhode Island KIDS COUNT gratefully acknowledges their assistance.

Betty King, Bill O'Hare and Jennifer Baratz of the Annie E. Casey Foundation for their encouragement and technical assistance. Brett Brown and Chris Botsko of Child Trends, Inc. for their suggestions on statistical analysis and presentation. Margaret L. Usdansky of the Freedom Forum Media Studies Center at Columbia University for her suggestions on data presentation and clarity.

Jack D. Combs, Research Administrator at the A. Alfred Taubman Center for Public Policy and American Institutions, Brown University, for database management and analyses.

Samara Viner-Brown, Division of Family Health, RI Department of Health, for coordination and analyses of data from the RI Department of Health.

Ann-Marie Harrington, Rhode Island College School of Social Work, Masters student, for research and data analysis.

Elizabeth Melendez, RI KIDS COUNT Project Assistant for her assistance with word processing and Project coordination.

Betsy Greenwood and Bill Mott of Greenwood Associates for the design and layout of the Factbook, Bill Mott for the illustration, and E.A. Johnson Co. for the printing of the Factbook.

Rick Schwartz of The Rhode Island Foundation for his assistance in Factbook design and communication.

Barbara Cortram, Vice President, Citizens Bank for her assistance with communication strategy for the Factbook.

Members of the Rhode Island KIDS COUNT Steering Committee and Technical Advisory Committees for their assistance in shaping the format and content of the Factbook.

The State Agency Directors of the Rhode Island Children's Cabinet for their ongoing support of Rhode Island KIDS COUNT.

Thomas Anton, Brown University; Nancy Gewirtz, Lenore Olsen, Rhode Island College; Trina Barnes, Urban League; William Hollinshead, RI Department of Health; Ron Gallo, Rick Schwartz, The Rhode Island Foundation for their review of the Factbook in draft form.

Sherry Campanelli, Alvin Johnson, Donald Marcelo, RI Department of Human Services; Linda Katz, RI Community Health Center Association; Kate Coyne-McCoy, RI Chapter, National Association of Social Workers; Senator Mary Patella; Thomas Anton, Brown University.

**Rent Burden:** Jean Burritt Robertson, RI Housing; David McCreadie, RI Food and Shelter Board; Tanya Kubas-Meyer, RI Coalition for the Homeless; Haven Miles, KIDSTART; Trina Barnes, Urban League.

**For their technical assistance with the following sections of the Factbook:**

**Child Population, Children in Single Parent Families:** Nancy Gewirtz, Lenore Olsen; Rhode Island College School of Social Work; Thomas Anton, Brown University.

**Median Household Income:** Jack Murphy, RI Department of Human Services, Child Support Program; Trina Barnes, Urban League; Gene Gessow, RI Public Expenditure Council.

**Children in Poverty:** Nancy Gewirtz, Lenore Olsen, Rhode Island College; Patricia Jaehng, Diocese of Providence; Jean Burritt Robertson, Rhode Island Housing; Bernie Beaudreau, Rhode Island Community Food Bank; Connie Gallant, Connecting for Children and Families; Ruth Hersh, The Rhode Island Foundation.

**Children Receiving Public Assistance:** Sherry Campanelli, Alvin Johnson, Donald Marcelo, RI Department of Human Services; Linda Katz, RI Community Health Center Association; Kate Coyne-McCoy, RI Chapter, National Association of Social Workers; Senator Mary Patella; Thomas Anton, Brown University.

**Children with Lead Poisoning:** Peter Simon, MD, Bill Dundulis, Susan Feeley, Cheryl LeClair, RI Department of Health; Ann-Marie Harrington, The Rhode Island Foundation.

**Women with Delayed Prenatal Care, Low Birthweight Infants, Infant Mortality:** William Hollinshead, Samara Viner-Brown, RI Department of Health; David Gagnon, National Perinatal Information Center.

**Births to Teens:** Trina Barnes, Urban League; Samara Viner-Brown, RI Department of Health.

**Women and Children Receiving WIC:** Bill Moskosky, Barbara Spencer, Bethany Algiers, RI Department of Health; Trina Barnes, Urban League.

**Children Receiving School Breakfast:** Robert Kaveny, Adrienne DiMeo, RI Department of Education; Bernie Beaudreau, RI Community Food Bank; Henry Shelton, George Wiley Center; Daniel Kertzman, RI Campaign to Eliminate Child Poverty; Trina Barnes, Urban League.

**Children without Health Insurance:** Sharon Kerman, Al Draper, RI Department of Human Services; Barbara Colt, Linda Katz, RI Health Center Association; Stanley Block, MD, Providence Ambulatory Health Care Foundation; Larry Culpepper, MD, Memorial Hospital; Carolyn Benedict-Drew, Family Service, Inc.; Samara Viner-Brown, RI Department of Health; John Farley, MD, Bradley Hospital; Melvin Bell, Karen Voci, The Rhode Island Foundation.

*continued, next page*

**Access to Dental Care:** Maureen Ross, RI Department of Health; Robert Person, St. Joseph Hospital Dental Clinic; Cornelia Anderson, DDS, Thundermist Health Center.

**Childhood Immunizations:** Kim Salisbury-Keith, RI Department of Health.

# REPRODUCTION RELEASE

(Specific Document)

## I. DOCUMENT IDENTIFICATION:

Title: 1996 RHODE ISLAND KIDS COUNT FACTBOOK.

Author(s):

Corporate Source: Rhode Island Kids Count/The Rhode Island Foundation Publication Date: APRIL 1996

## II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

The sample sticker shown below will be  
affixed to all Level 1 documents

Check here

### For Level 1 Release:

Permitting reproduction in  
microfiche (4" x 6" film) or  
other ERIC archival media  
(e.g., electronic or optical)  
and paper copy.

PERMISSION TO REPRODUCE AND  
DISSEMINATE THIS MATERIAL  
HAS BEEN GRANTED BY

\_\_\_\_\_  
Sample \_\_\_\_\_

TO THE EDUCATIONAL RESOURCES  
INFORMATION CENTER (ERIC)

The sample sticker shown below will be  
affixed to all Level 2 documents

Check here

### For Level 2 Release:

Permitting reproduction in  
microfiche (4" x 6" film) or  
other ERIC archival media  
(e.g., electronic or optical),  
but *not* in paper copy.

Level 1

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."
